INCREASE OF TRANSIT SPEED

Lecture 8

TRANSIT SPEED

- Operating speed of transit impacts performance, costs and role in the city

- Increasing speed results in

✓ Shorter passenger travel times
✓ Decreased investments and operating costs for the agency
✓ More significant result – attraction of new transit passengers

- Decrease in speed results in

✓ Traffic congestion
✓ Increased operator’s cost
✓ Diminished significance of transit services

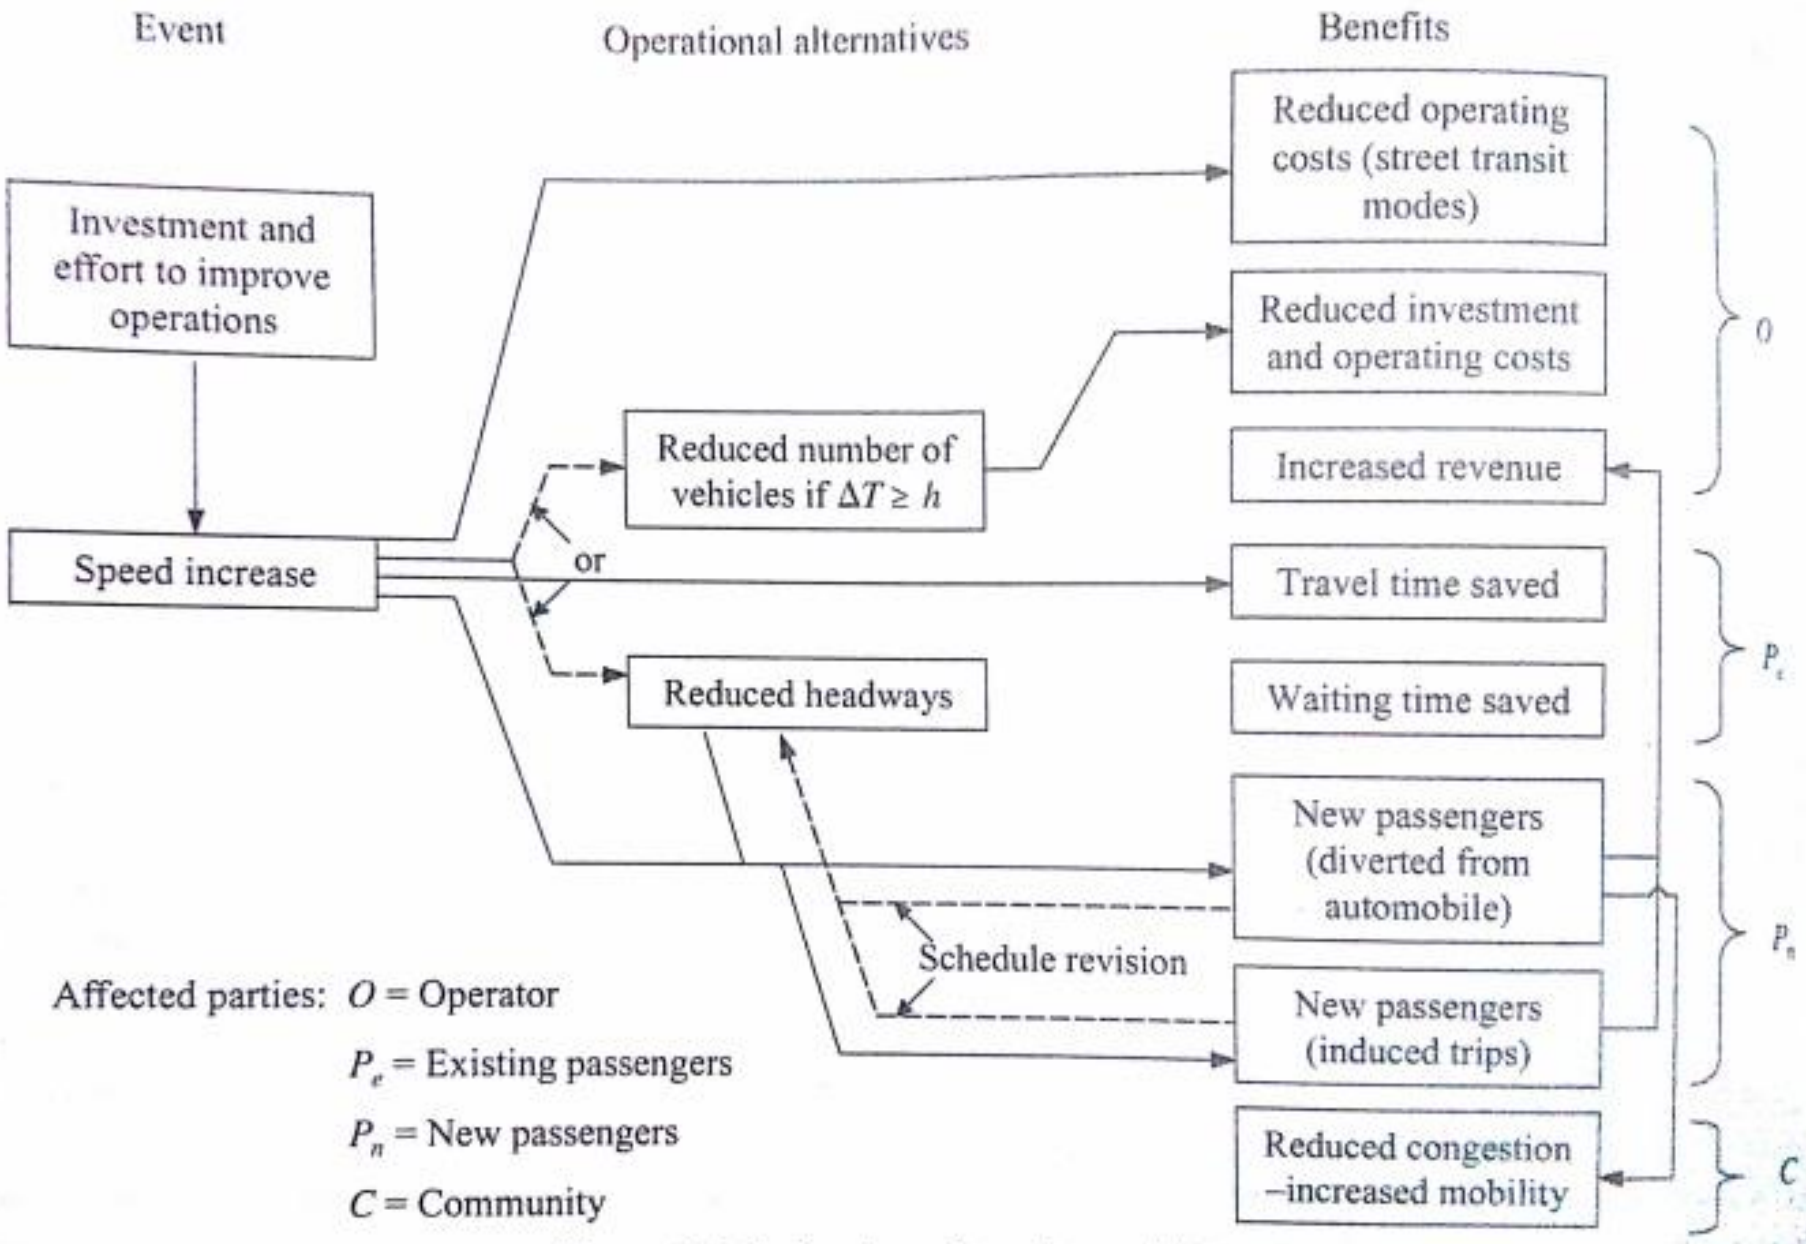

Figure 2.5 *Evaluation of transit speed increase.*

Possible measures for Speed Increase

- Vehicle design and Performance Characteristics

✓ Interior circulation
✓ Double channel doors
✓ Low-floor vehicles
✓ Dynamic characteristics

- Intersection and street design

✓ Intersection design that facilitates transit operation should have precise channelization, conveniently located transit stops, turning lanes, pedestrian control and protection etc.
✓ Elimination of Curb parking
✓ Construction of bus-stop bulb-outs or sidewalk extensions
✓ Introduction of transit lanes

- Traffic signal priorities for Transit

✓ Passive Priority measures
✓ Active priority measures
✓ Signal pre-emption

- Transit Stops

✓ Increasing spacings between stops
✓ Alternating near-side and far-side stop locations with synchronized signalization

- Elements of Transit Operations

✓ Faster fare collection
✓ Changes in route layout
